

Assessing the Newborn Baby

Intended Learning Outcomes

- Screening
- What is the Auditory Brainstem Response?
- Applying electrodes
- Determining threshold

Screening

Screening Criteria

- The condition
- The test
- The intervention
- The screening programme
- Implementation criteria

Newborn Hearing Screening Aim

“To identify all children born with moderate to profound permanent bilateral deafness within 4-5 weeks of birth”

Permanent Childhood Hearing Impairment (PCHI)

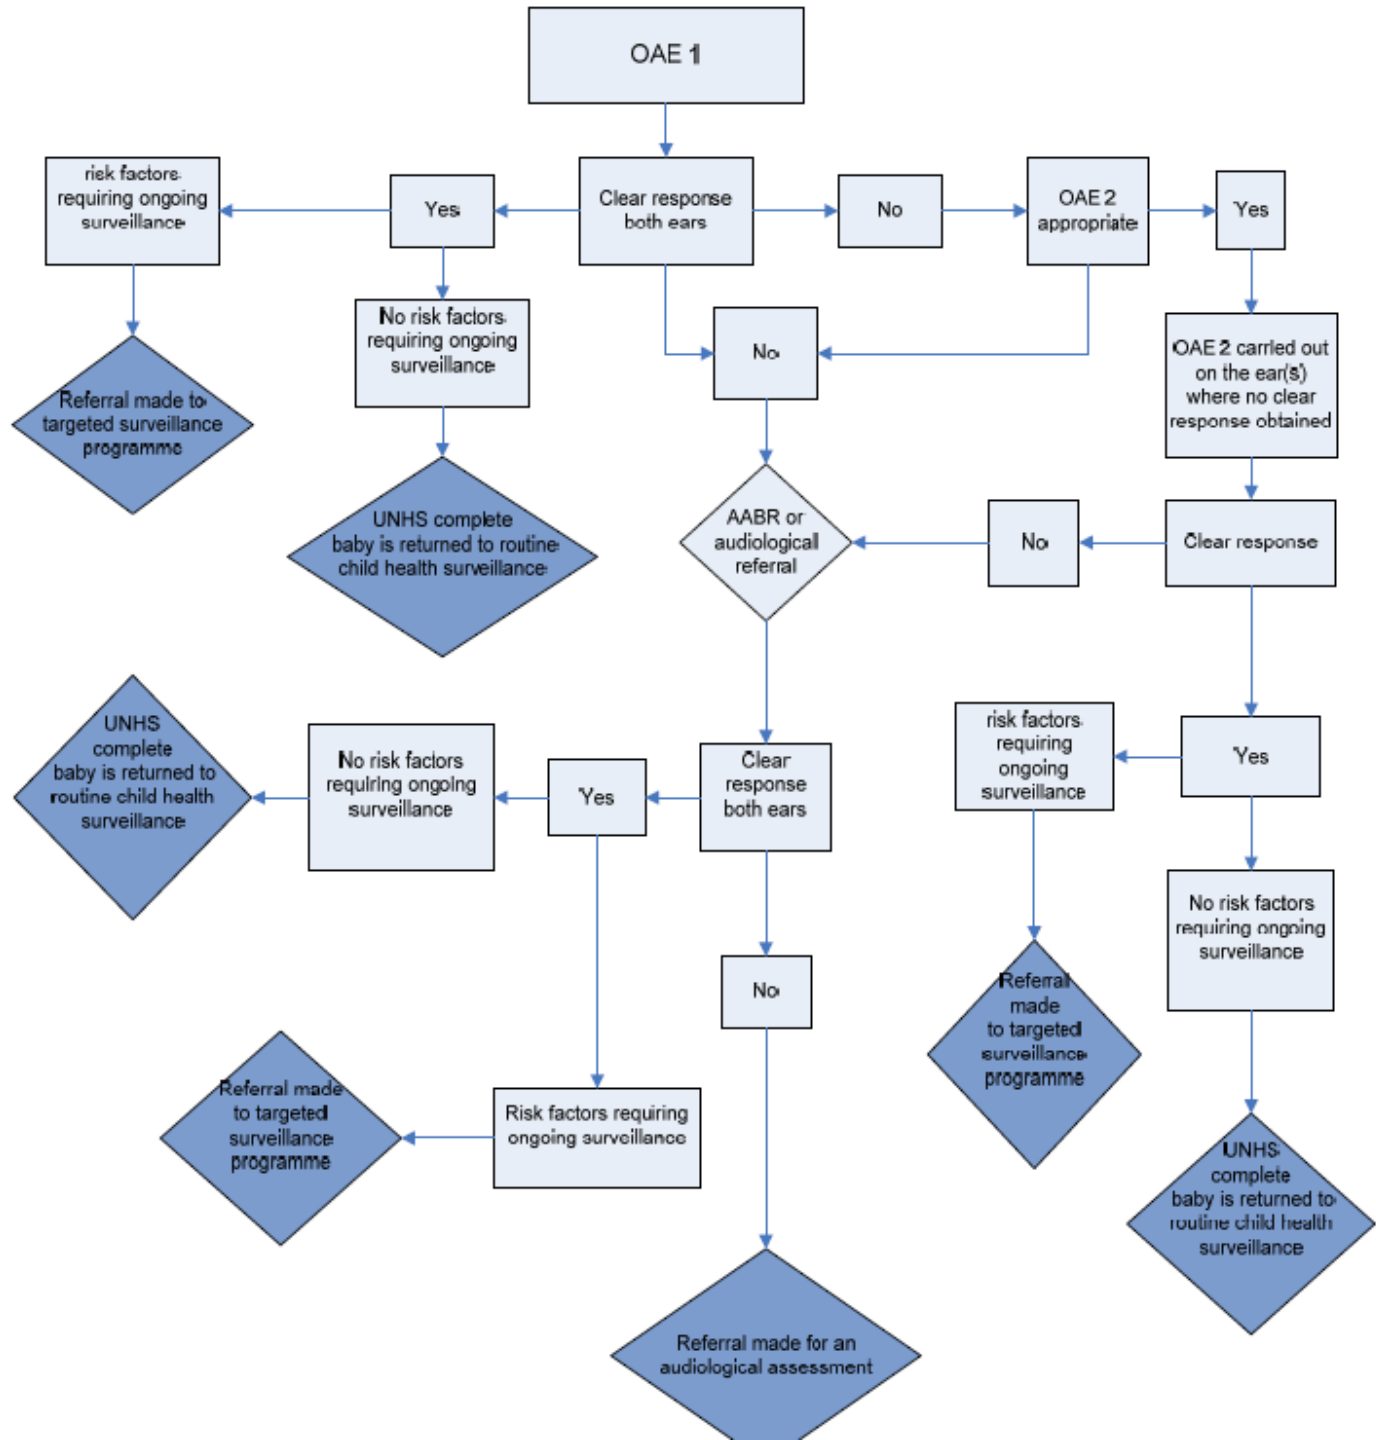

Techniques

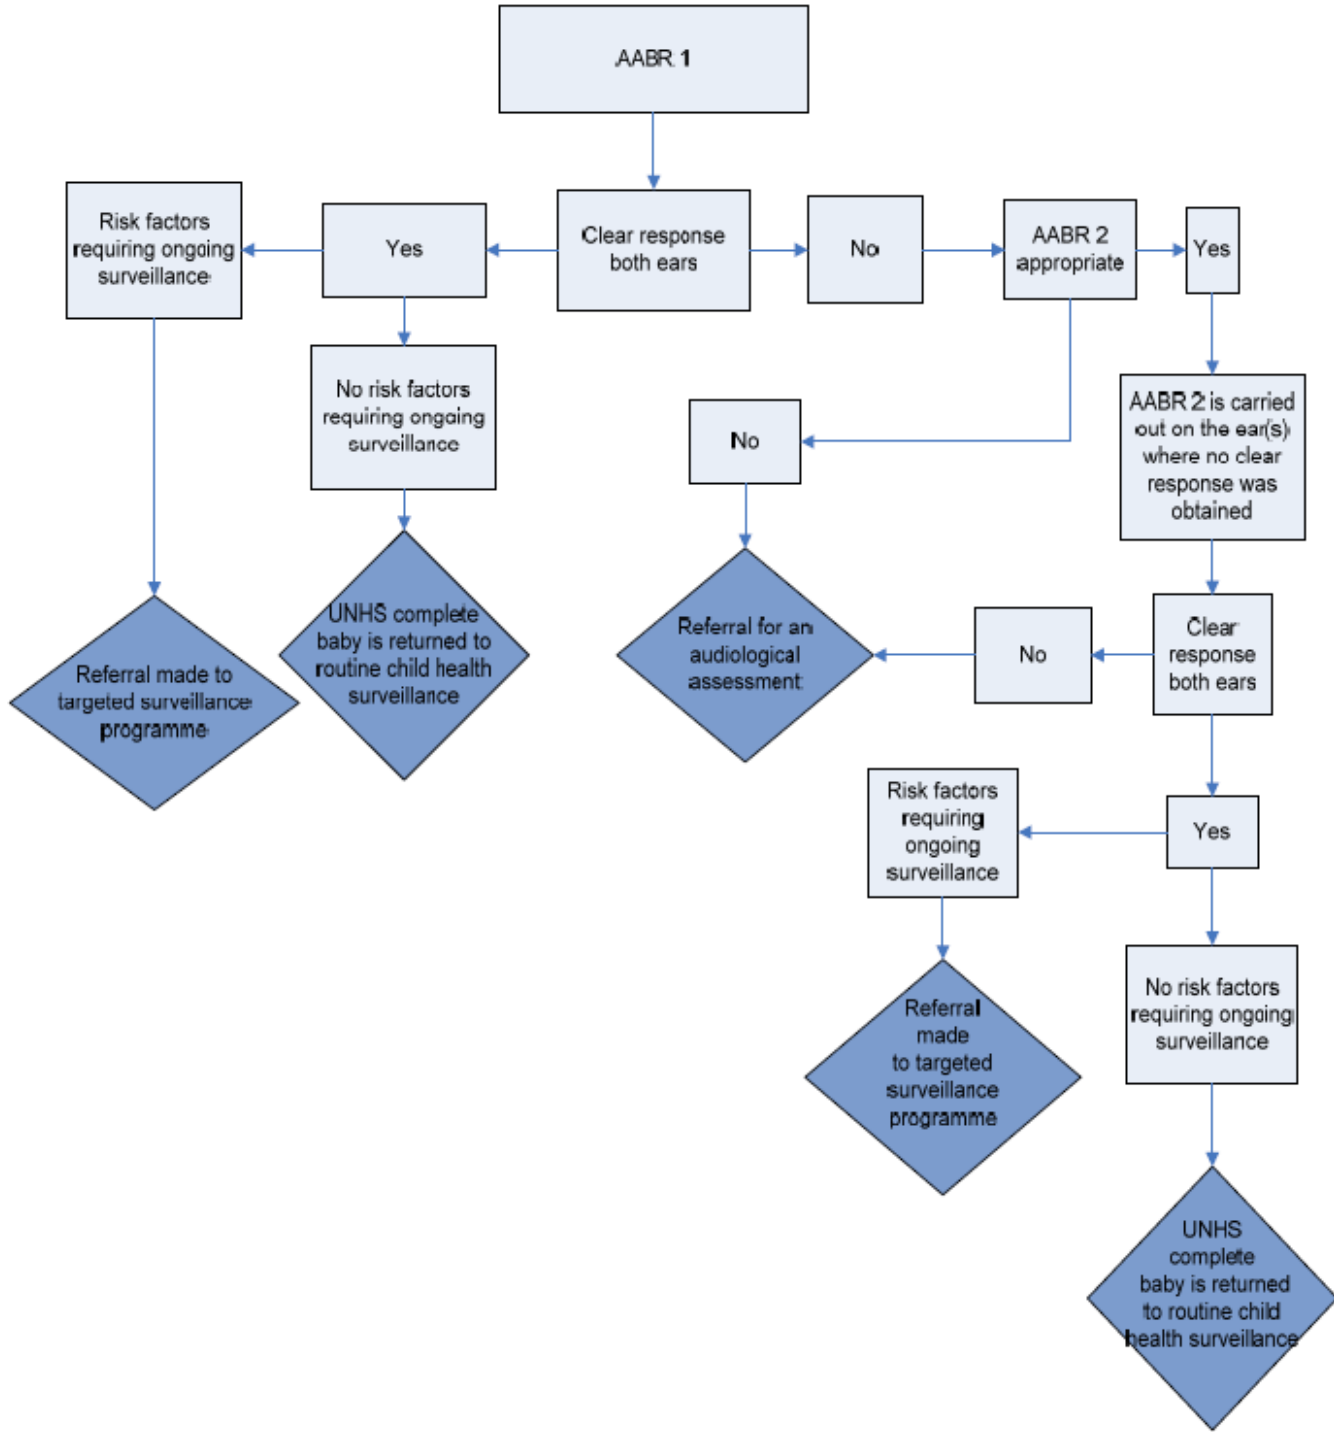

- Otoacoustic Emissions
 - Acoustic Response
 - Only as far as the cochlea
 - Baby settled and room quiet

- Auditory Brainstem Response
 - Electrophysiological
 - Baby asleep and room quiet

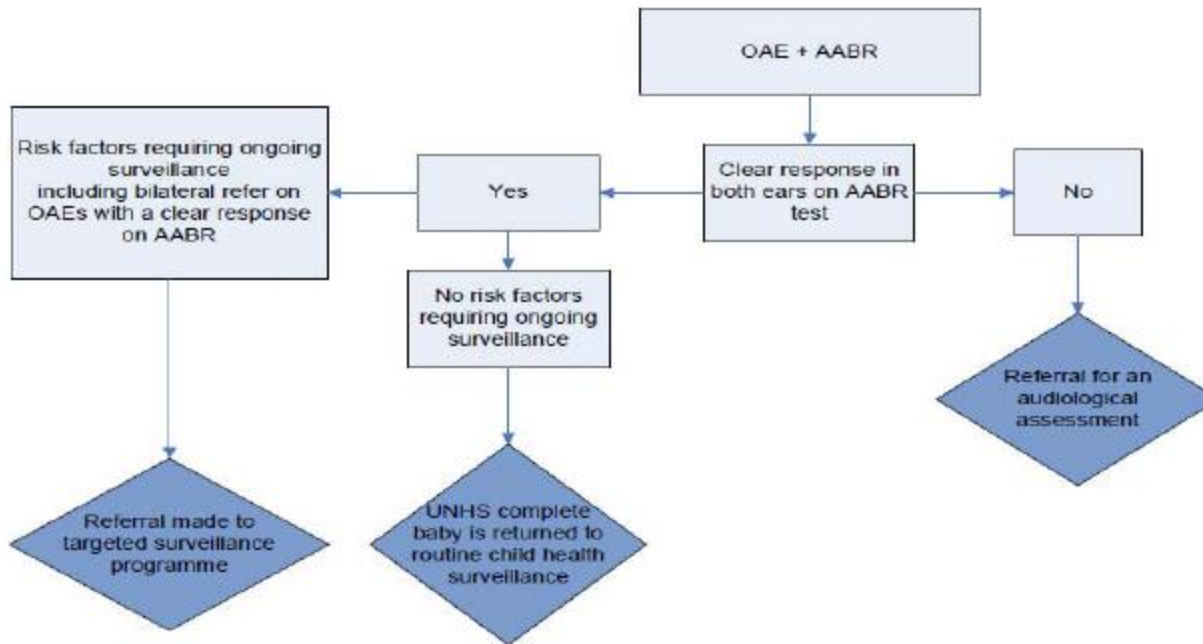

- At Screen:
 - Neither is frequency specific
 - Both fully automated

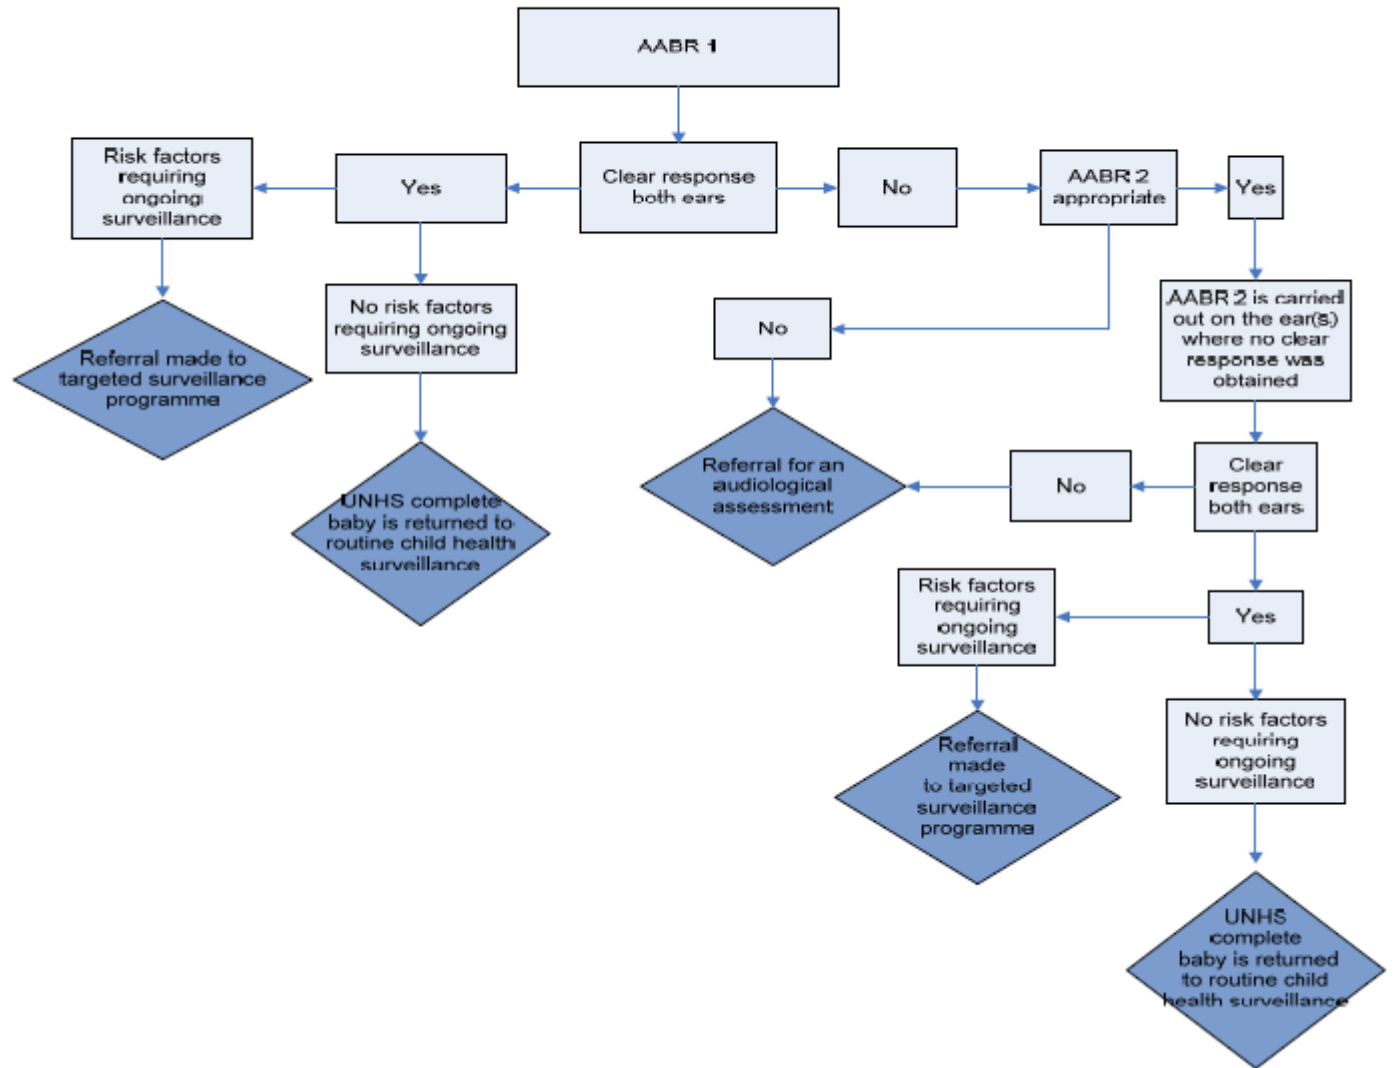

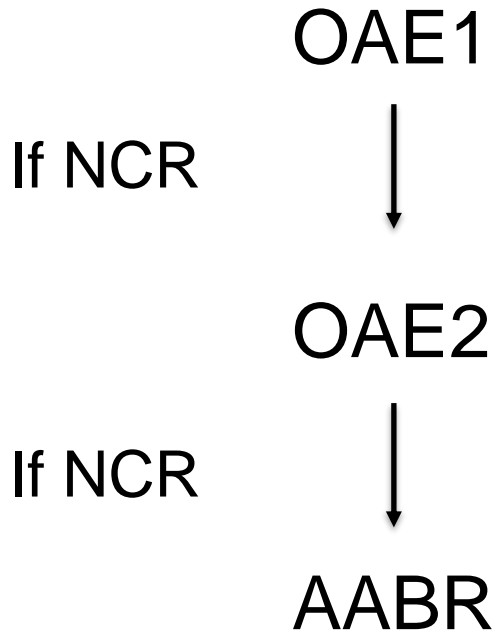

Patient Flowchart NICU Babies –OAE Model

Well Babies

NICU Babies

OAE
&
AABR

Excluded from Screen

- **Microtia / external ear canal atresia** - where there is no patent ear canal in one or both ears
- **Neonatal bacterial meningitis or meningococcal septicaemia** – Confirmed or strongly suspected
- **Confirmed Congenital Cytomegalovirus**
- **Presence of a ventriculo-peritoneal shunt**

Definitions

- **Sensitivity** (true positive rate, hit rate):
the proportion of cases with the target disease that the test correctly identifies as having the disease
- **Specificity** (true negative rate):
the proportion of cases without the target disease that the test correctly identifies as not having the disease

Additional Screening?

- 136 children with a unilateral or bilateral PCHI of any degree identified / confirmed at school age (prevalence 3.65/1000).
- Sixty-four (1.79/1000) (49%) had been identified by UNHS.
- The post-neonatal prevalence was attributed to;
 - Congenital PCHI not identified by UNHS
 - Mobility of Population
 - Late-onset or acquired HL
 - Progressive PCHI

Late onset

- “Even with UNHS in place post-neonatal routes to identification need to be maintained and improvements investigated”

(Watkin & Baldwin 2012)

Targeted follow-up

- Syndromes associated with hearing loss
- Cranio-facial abnormalities including cleft palate
- Confirmed congenital infection (toxoplasmosis, rubella or CMV)
- NICU >48 hours and no OAEs despite clear AABR

Screening Programmes

Newborn Hearing

Newborn Hearing Screening Programme (NHSP): recommendations for changes in targeted follow up procedures

Author(s)	Sally Wood, Adrian Davis, Graham Sutton
date	21/11/11
audience	NSC, NHSP Programme Centre, Directors of Public Health (SHA and PCT), Screening leads (SHA and PCT), commissioners, NHSP teams (Team Leaders, Screening Managers, Medical Leads, Heads of Paediatric Audiology), Regional teams, NHSP QA board, NHSP Clinical group, RCP, Royal College Midwives, BAAP, Paediatricians in Audiology, NDCS, BSA, BAA

Consultation

This evidence and its associated recommendations are out for consultation until 09/01/12. In order to respond to the consultation please use the dedicated response form on the NHSP website at <http://hearing.screening.nhs.uk>. We plan to produce a response to the consultation and recommendations for future practice in February 2012.

Terminology	1
1.0 Aims.....	2
2.0 Introduction.....	2
3.0 Targeted follow up: current guidance and practice	3
4.0 Evidence	4
4.1. Eligibility for targeted follow up	4
4.2 Offer of targeted follow up	5
4.3 Uptake of targeted follow up	6
4.4 Hearing outcomes in the targeted follow up group	6
4.5 PPV for PCHI for all screening outcomes	7
4.6 Risk factors	8
4.7 Resources required for targeted follow up.....	10
5.0 Summary of evidence	10

Risk factor identification

- Family history of hearing loss by questioning of parents is difficult to identify correctly (Wood et al, 1995).
 - Families tend to have poor knowledge of this risk factor
 - Difficult for non specialist staff to distinguish between a likely congenital/early onset hearing loss and later onset/acquired losses due resulting from otitis media with effusion.

Summary of evidence

- Uptake of targeted follow up is 55% for the risk factor group and 17% for the incomplete screen group.
- Incomplete screen group: Positive predictive value for permanent childhood hearing impairment = 0.95/1000
 - Thus a screening programme with 5000 births p.a. could expect one case of PCHI in this group every 15 years.

Table 6: Data for PPV and NNT for risk factors

	PCHI=NO			PCHI=YES			PPV/1000 if screen refer	PPV/1000 if not refer	NNT if screen refer	NNT if not screen refer
	Screen refer	Not screen refer	Sum:	screen refer	Not screen Refer	Sum:				
Syndrome associated with hearing loss-other than Downs	323	1243	1566	95	9	104	227.27	7.19	4	139

A list of documents and resources available for public use.

Recommended Procedures and Publications

The documents and information on this page, except those awaiting review, are the responsibility of the Professional Practice Committee (PPC; formerly Education Committee).

Comments on these documents and this page are welcomed and should be sent to ppcadmin@thebsa.org.uk marked for the attention of the Chair of the PPC.

Although care has been taken in preparing the information supplied by the British Society of Audiology, the BSA cannot guarantee the interpretation and application of it. The BSA cannot be held responsible for any errors or omissions and accepts no liability whatsoever for any loss or damage howsoever arising.

The documents under the category of Awaiting Review have not yet been formally approved by BSA (e.g. according to its procedure for processing documents). However, they may have been approved by another group, see comments next to each document.

Accreditation Criteria

Title	Date	Status	Category	Comments	Resource Type
BSA Short Courses – accredited providers	2015	Current	Documents. PPC Group Documents. Accreditation criteria.		Accreditation criteria
Minimum training standards for aural care	2013	Current	Documents. Procedures. Accreditation criteria.	Minor amendments made March 2015	Accreditation criteria
Guidelines on the training of industrial audiometricians	2008	Current	Documents. Procedures. Accreditation criteria.		Accreditation criteria
British Society of Audiology guidelines on minimum training standards for otoscopy and impression taking	2004	Current	Documents. Procedures. Accreditation criteria.	Under minor review	Accreditation criteria

Recommended Procedure

Auditory Brainstem Response (ABR) testing for Post-newborn and Adult

Date: September 2019

Due for review: September 2024

CO104-84 (17/12/2019)

Practice Guidance

Guidelines for the Early Audiological Assessment and Management of Babies Referred from the Newborn Hearing Screening Programme

Date: December 2021

Due for review: December 2026

OD104-98 (01/12/2021)

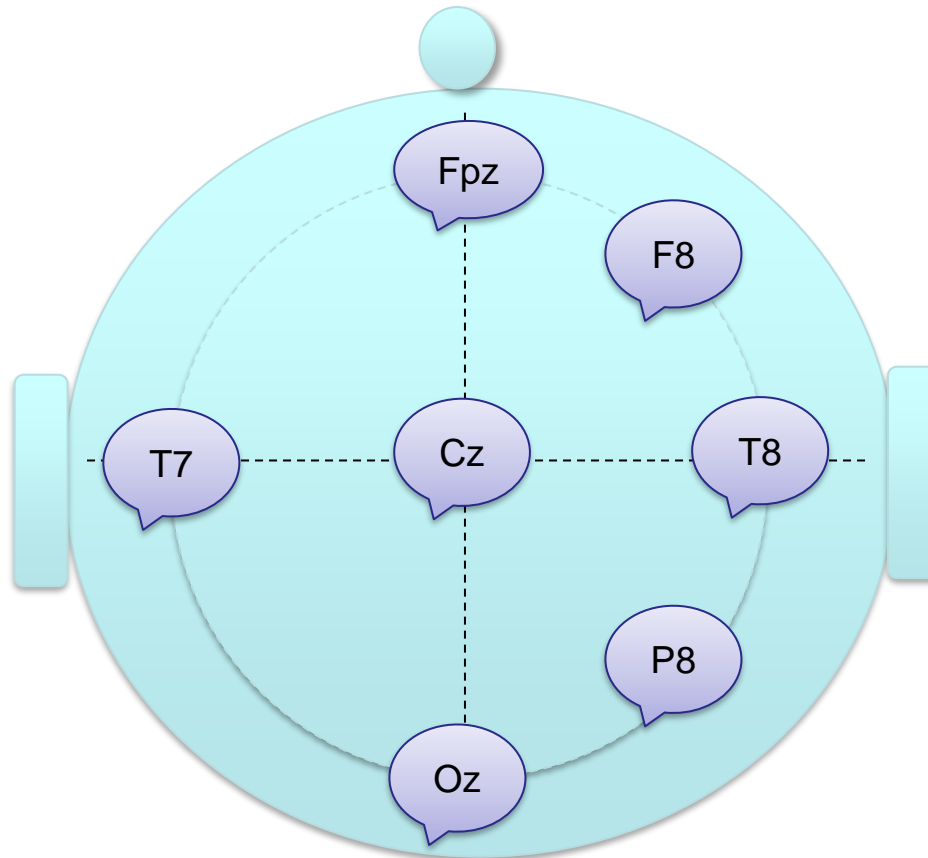

Electroencephalography (EEG)

- EEG represents an electrical signal from a large number of neurons
- EEG is formed from different brain rhythms occurring either spontaneously or evoked by external stimuli, that overlap and interact with each other.
- This EEG activity can be looked at in the time domain or the frequency domain.

Electrodes Montage

Prefrontal
Frontal
Temporal
Posterior
Occipital
Central/Vertex

Electrodes

- Reference
- Active
- Common

- Plaiting
- Crossing cables
- Avoid extension leads

Electrodes

- Silver chloride / Gold cap
- Disposable / reusable
- Contact with skin $<5\text{k}\Omega$ recommended
- Balanced – difference $<2\text{k}\Omega$

Commonly used Clinical AEP

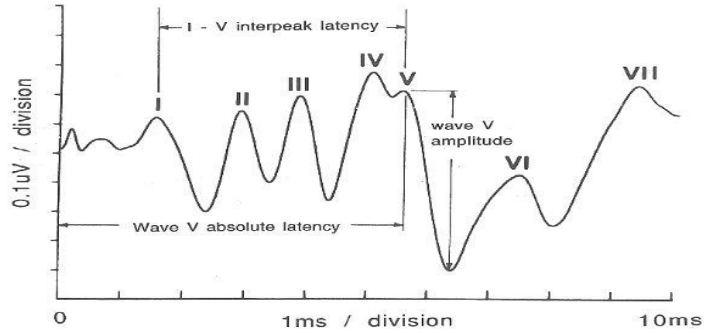

- Cochlear microphonic (CM)
- Auditory Brainstem Response (ABR)
- Cortical Evoked Auditory Potential (CAEP)

ABR Morphology

Effects of maturation on the ABR waveform

ABR Morphology

ABR: Typical Responses

- Latency: <math><15\text{msec}</math>
- Amplitude: >0.04 μV
- Attention / Arousal Level Independent
- Frequency Specific
- No Habituation

Stimulus

- Types
 - Tone pip / burst
 - Narrow band chirp (NB-chirp)
- Limitations
 - $\leq 4\text{kHz}$
 - Time taken

Relationship with the PTA

- dBnHL
 - “Stimulus level relative to adult psycho acoustic threshold. In these guidelines the NHSP reference equivalent threshold levels are used”
- dBeHL
 - “Estimated PTA from electrophysiological thresholds”

Relationship with the PTA

- Correction factors affected by
 - Age
 - Frequency
 - Transducer, circumaural, inserts, BC
 - Stimulus type
- More accurate with severity of loss
- Rounded to the nearest 5dB

Signal to Noise

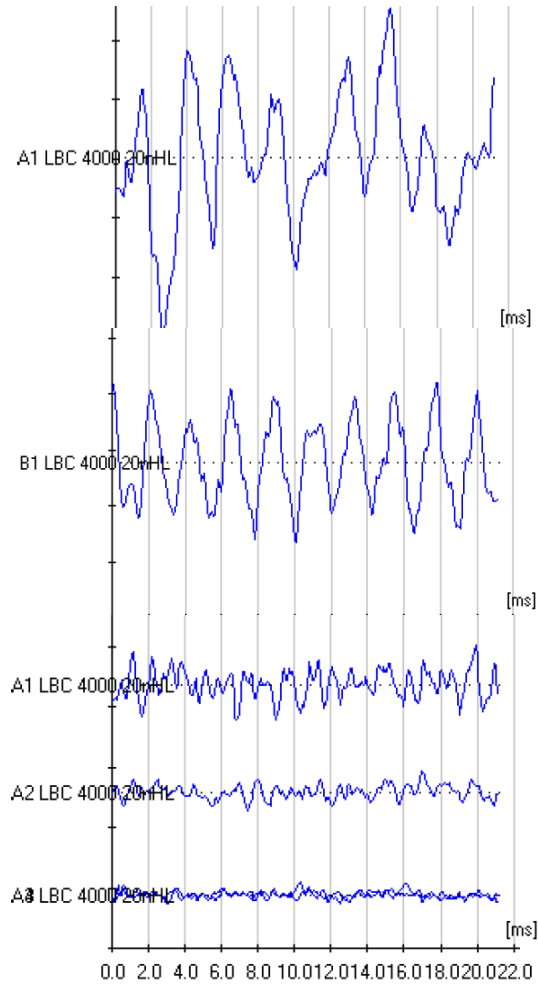

Good

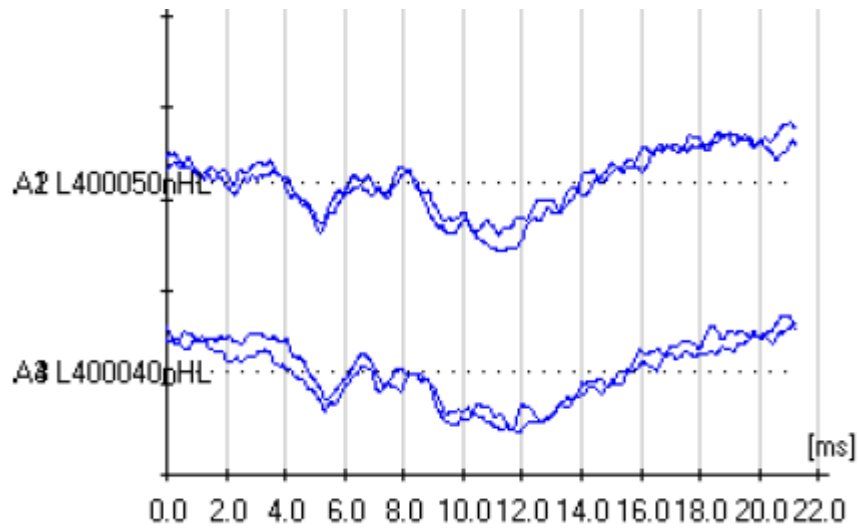

Bad

Averaging

Averaging

Waiting...Waiting...

Electrical Interference

- Person
 - Electroencephalogram (EEG)
 - Electromyogram (EMG)
 - Electrocardiogram (ECG)
- Ambient

Good electrophysiological practice

- High Signal
 - Electrode location
 - Good transducer placement
- Low background noise: Muscle
 - Relaxed
 - Electrode location
- Low background noise: Electrical
 - Low electrode impedance
 - Location, location, location

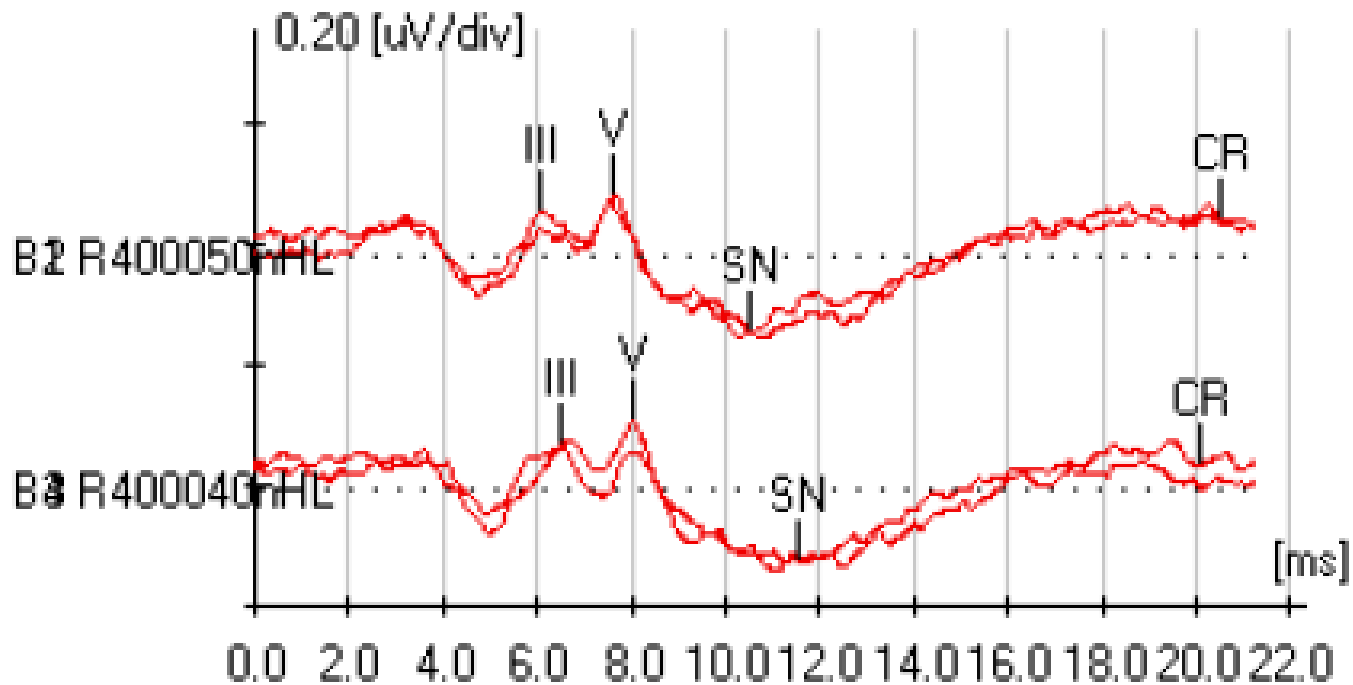

Good electrophysiological practice

- Environment
 - Location in room
 - Material of pram
- Parameters
 - Notch filter
 - High pass filter – to 50Hz
 - Artefact rejection – lengthen test duration
 - Bayesian weighting

ABR: Parameter Impact

- Stimulus
 - Rate
 - Intensity
 - Frequency
- Recording
 - Filter
 - Gain

ABR Morphology

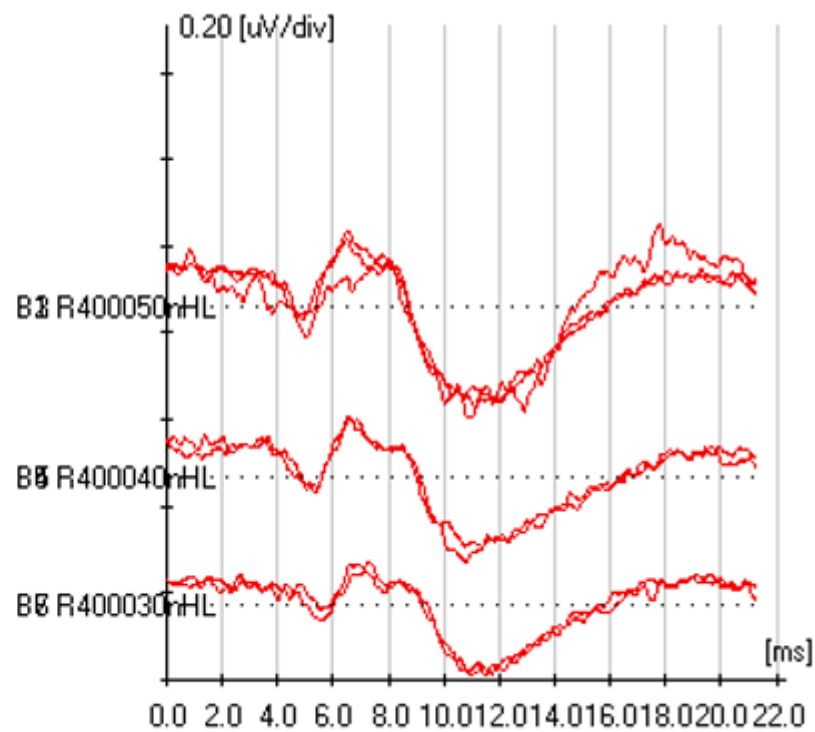

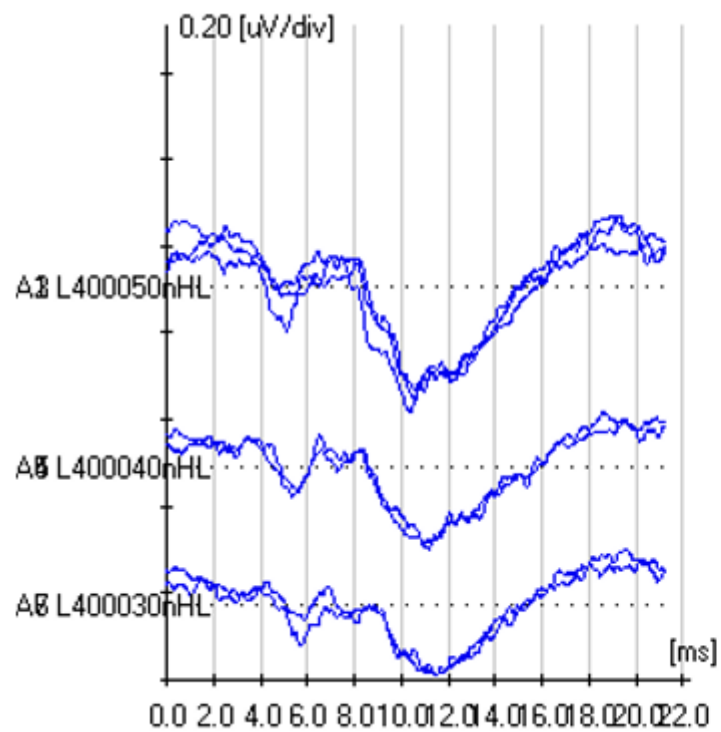

Post Auricular Muscle

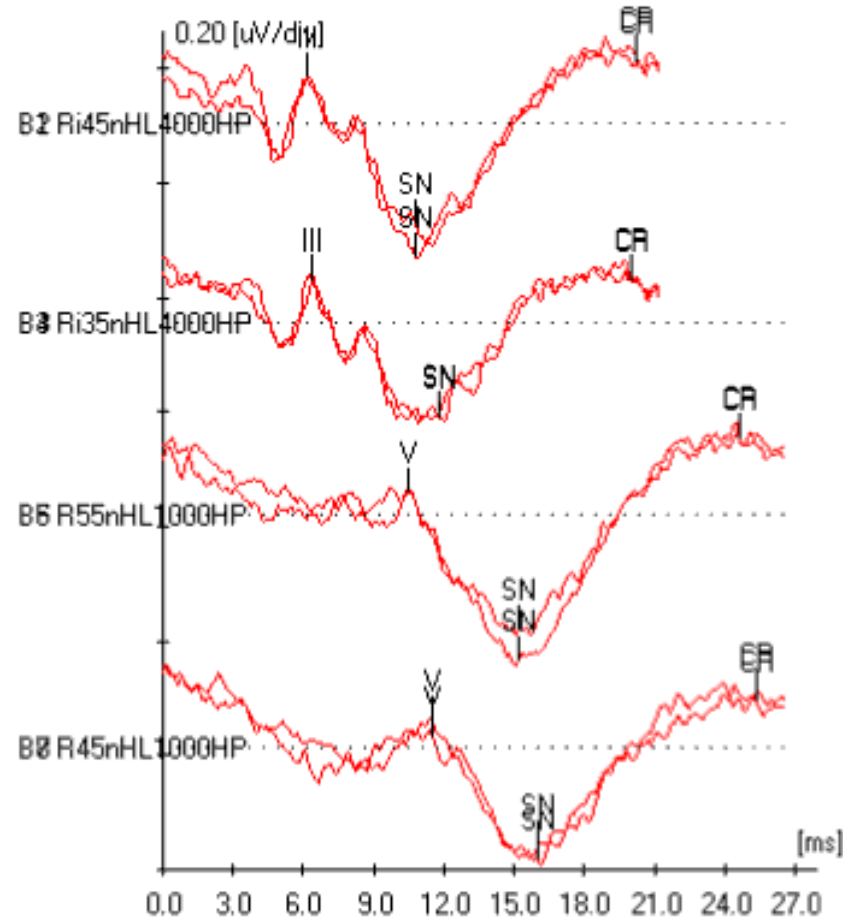

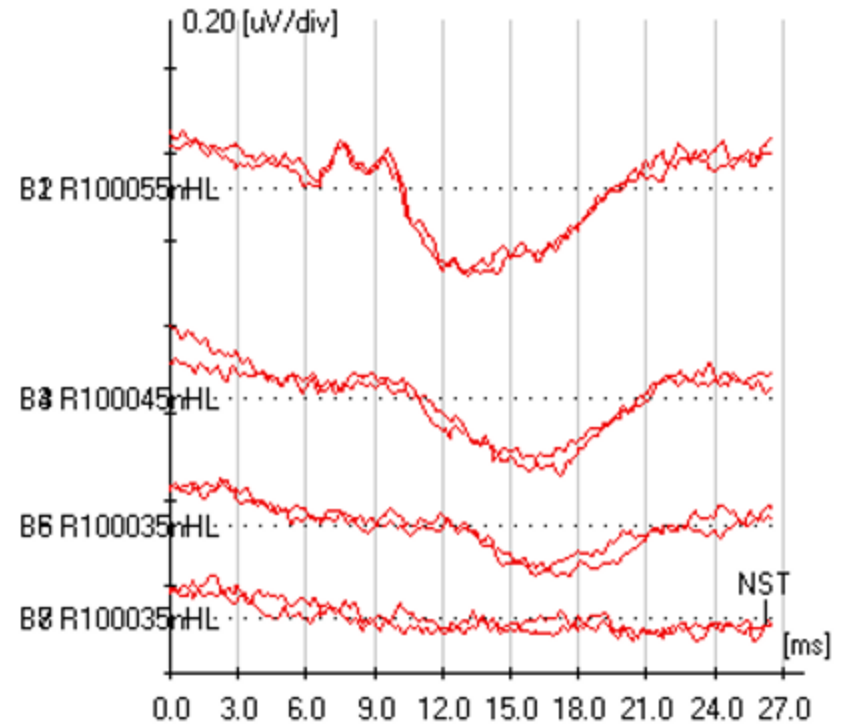

ABR – Intensity Effect

ABR – Frequency Effect

Transducer

Position

Pressure

Held on by clinician

- Caution:
 - maximum levels
 - 1kHz BC
 - shunt
