# Practice Listening and Understanding Speech (PLUS): Feasibility of providing auditory-cognitive training alongside hearing aids in the NHS

Mengfan Wu<sup>1,2</sup>, Emma Broome<sup>1,2</sup>, Antje Heinrich<sup>3</sup>, Helen Henshaw<sup>1,2</sup>

<sup>1</sup>NIHR Nottingham Biomedical Research Centre, Nottingham, UK; <sup>2</sup> Hearing Sciences, Mental Health and Clinical Neurosciences, School of Medicine, University of Nottingham, Nottingham, UK; <sup>3</sup>Manchester Centre for Audiology and Deafness (ManCAD), School of Health Sciences, University of Manchester, UK

### **1. Background**

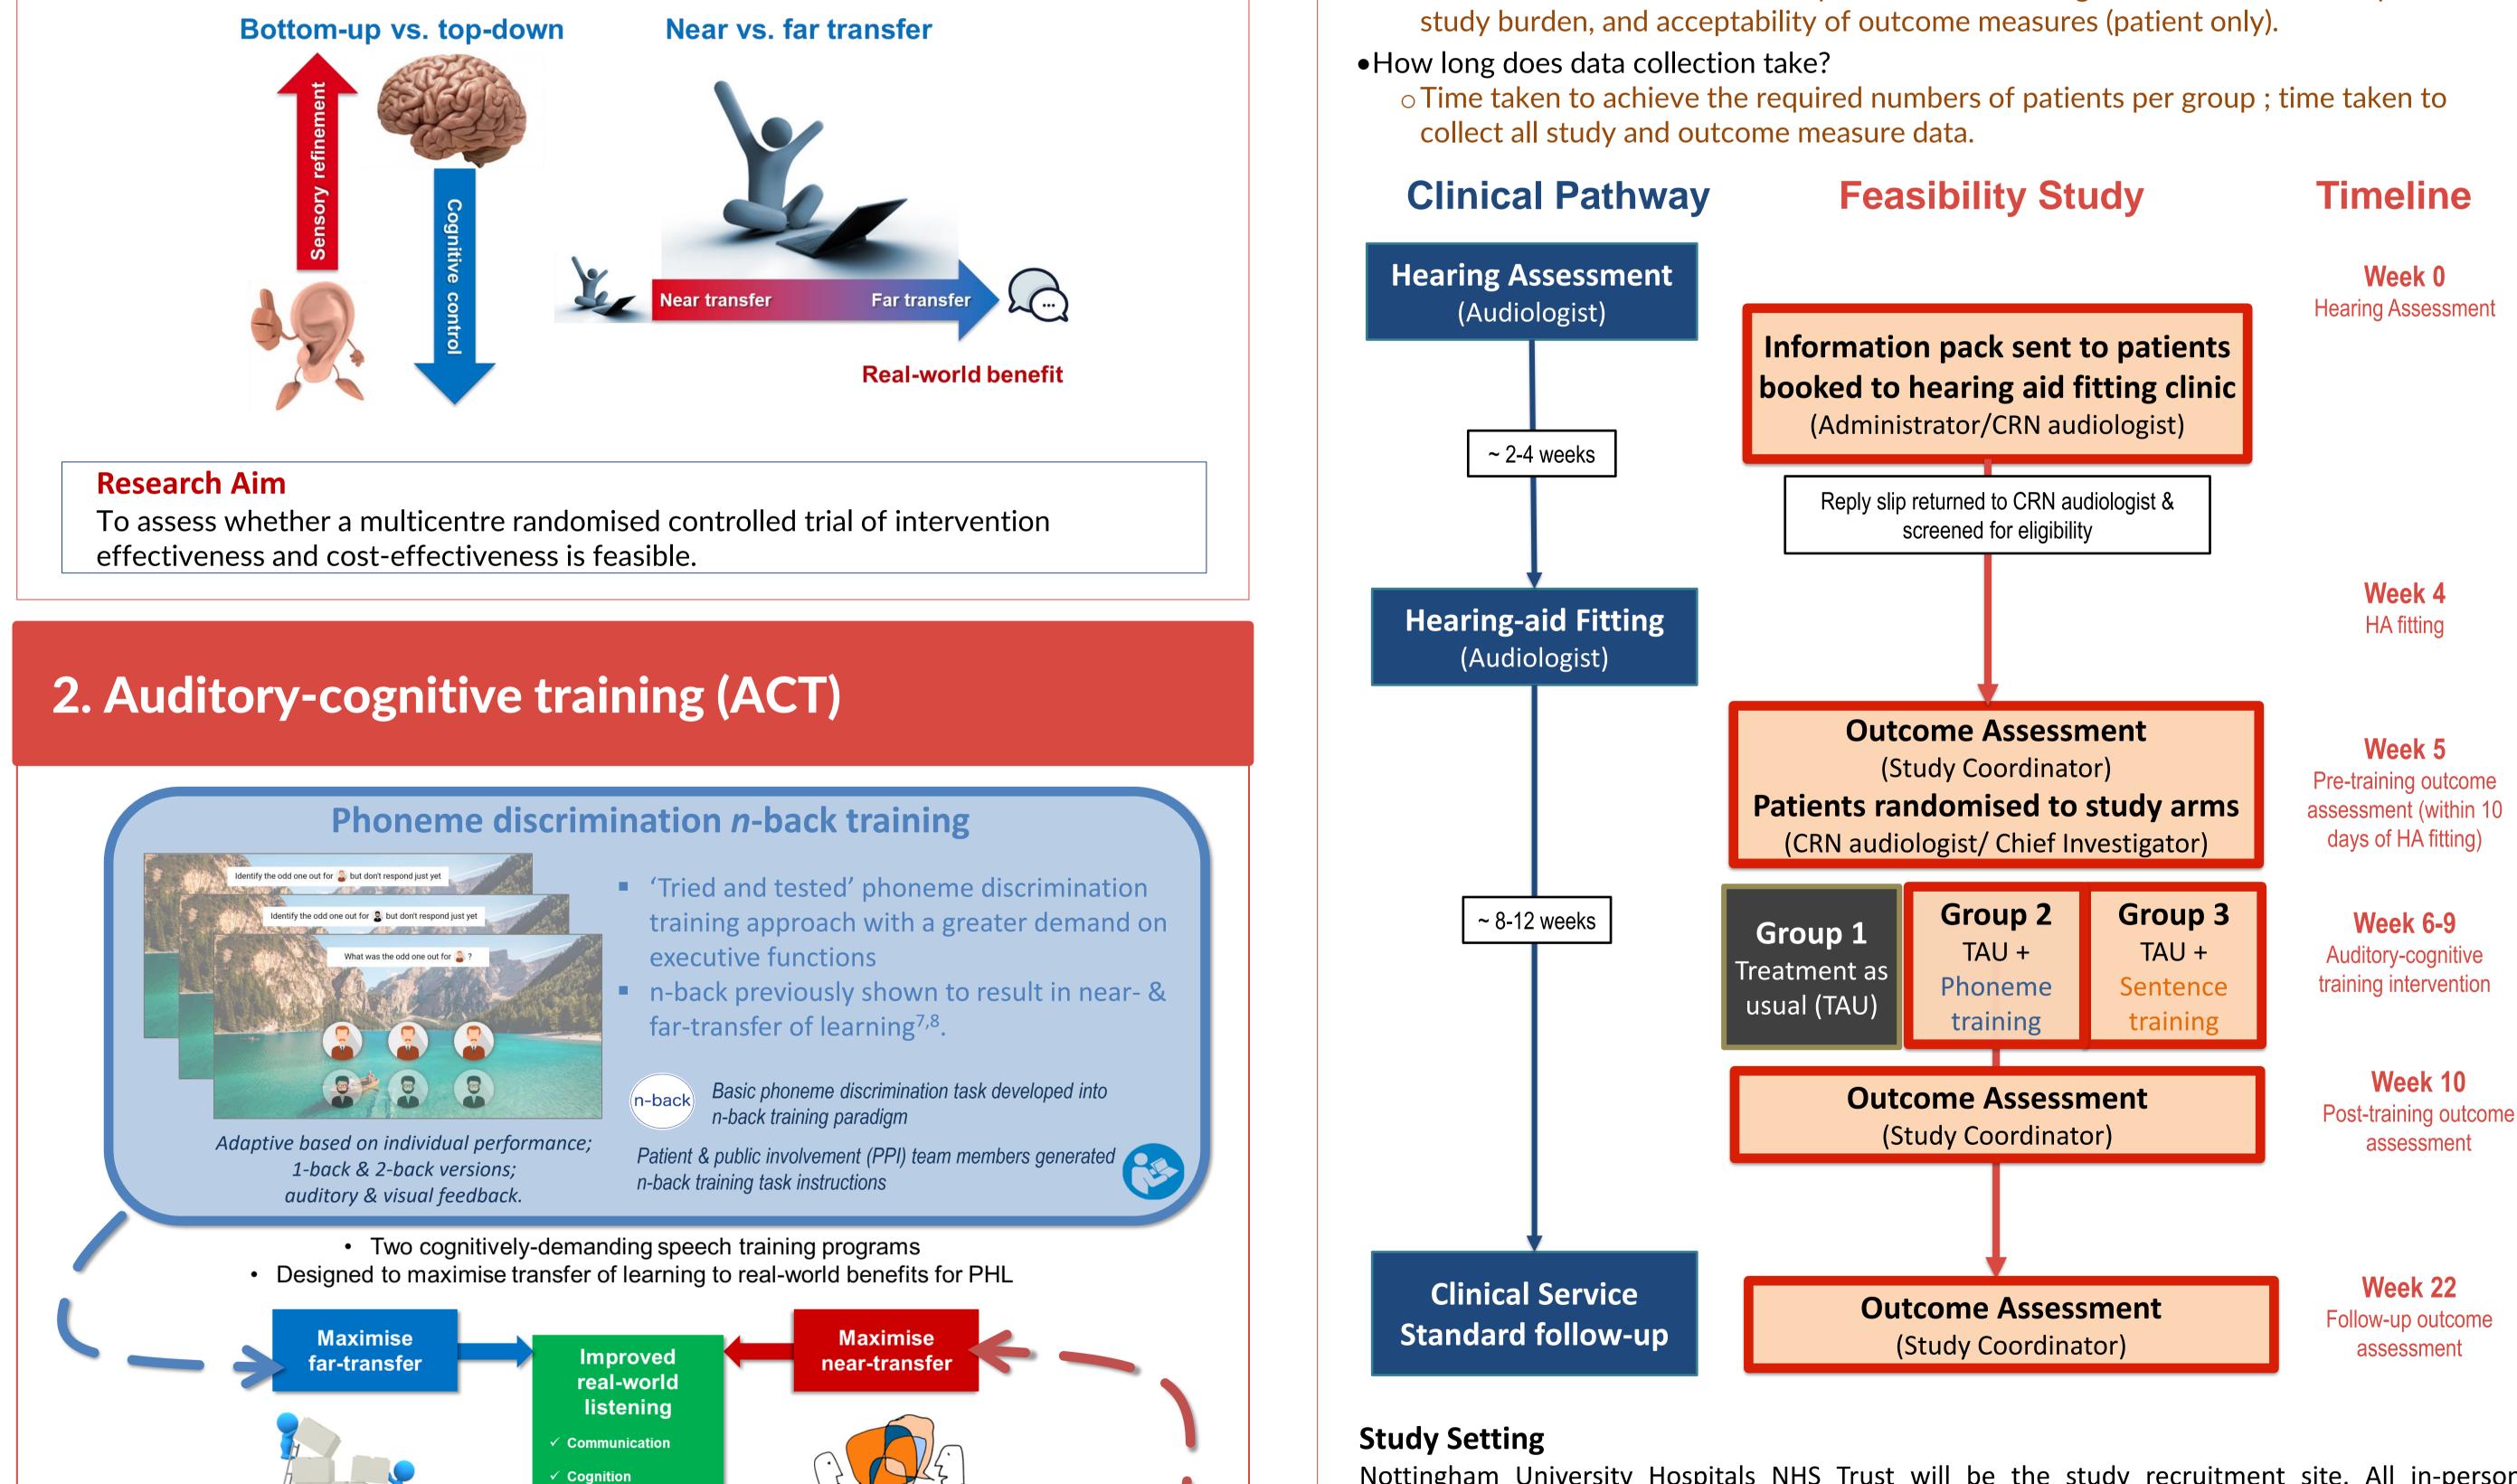

Auditory training (AT): teaching the brain to listen through active engagement with sounds.

Cognitive training (CT): mental exercises designed to improve core cognitive abilities.

For people with hearing loss (PHL) and hearing aid (HA) users, AT & CT interventions aim to improve real-world listening through the development of auditory and cognitive skills.

Evidence from literature and our own research shows that for PHL:

- AT results in on-task learning, but evidence for transfer is mixed<sup>1</sup>. •
- Phoneme discrimination AT transfers to complex, but not simple outcomes that tax topdown cognitive control (executive functions) $^{2,3}$ .
- CT that targets improvements in working memory capacity (Cogmed RM) does not transfer to improvements in untrained outcomes<sup>4,5</sup>.
- A combined auditory-cognitive training approach may offer the greatest benefits to realworld listening<sup>5,6</sup>.

## 3. Feasibility Study of 105 new adult HA users

The feasibility study has been designed to assess:

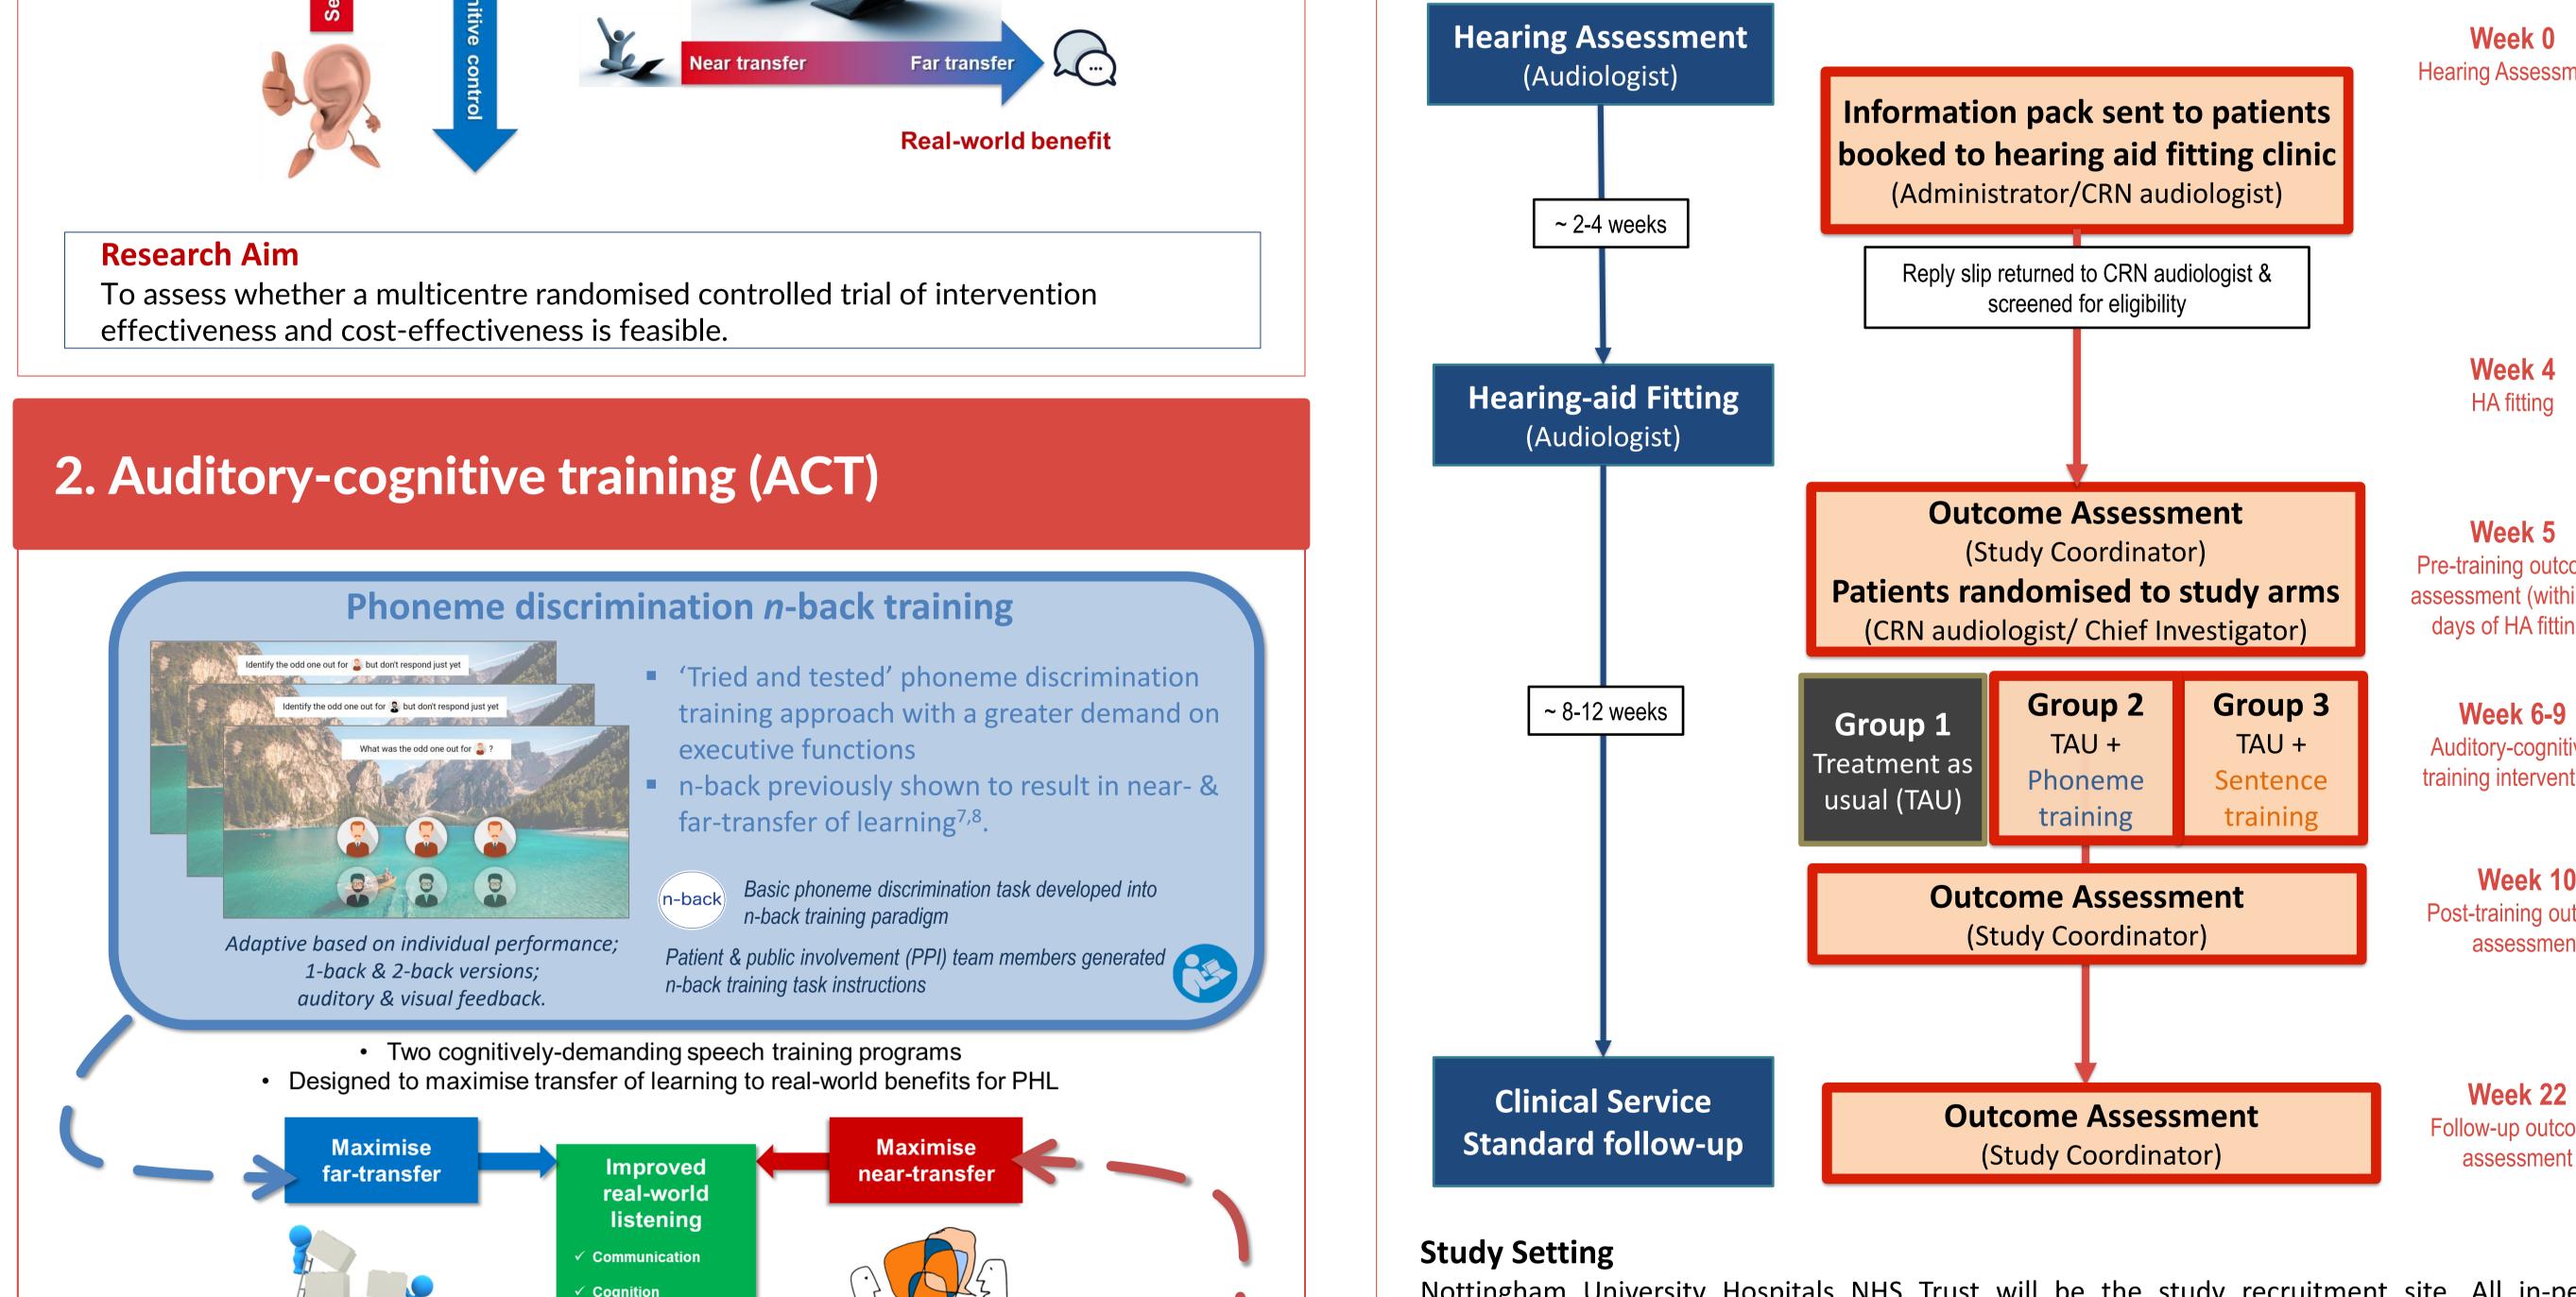

•What is the best way to provide ACT interventions to NHS audiology patients, and what does it cost?

• To collect quality of life data and identify any resources or costs associated with the delivery of the training interventions from a health (NHS) and social care perspective, from which to calculate cost-utility of the interventions in the anticipated randomised controlled trial.

•What are the important rates required to inform a future pragmatic randomised controlled trial of ACT efficacy?

- Patient recruitment & attrition rates; patient attrition rates at a 12-week postintervention outcome assessment; the completeness of all outcome measures at all assessment timepoints.
- •What do patients and clinicians think about the ACT interventions and the trial processes? • Semi-structure interviews with patients and audiologists about recruitment procedures,

#### Timeline

Nottingham University Hospitals NHS Trust will be the study recruitment site. All in-person assessments will take place on NUH premises in facilities suitable for the assessment of hearing and cognition. Participants will also be informed of the study via Sherwood Forest Hospitals NHS Foundation Trust (Audiology department), who will act as a Participant Identification Centre.

Train the cognitive 'building blocks' of effortful listening using small parts of speech

Practice listening to competing talkers in listening situations that PHL find challenging

#### **Competing speech training**

Speech perception

Quality of life

- Cognitively-demanding competing speech task and one of the most common complaints of PHL
- Based on the Coordinate Response Measure<sup>9</sup>, with ecologically valid stimuli that reflect the real-world listening challenges of PHL.

*Photovoice<sup>10</sup>: 10 adult hearing-aid users provided 5-6 photographs of challenging listening situations* Sentences for 6x situations recorded by 4x talkers

visual feedback.

#### **Inclusion criteria**

- $\sqrt{10}$  Are 18 years of age or over
- Recommended 1 or 2 hearing aid(s) for the first time
- $\sqrt{1}$  Have good understanding of written and spoken English
- $\sqrt{1}$  Internet access at home (training interventions will be home-delivered via the internet)

If feasible, apply for funds to conduct a full-scale randomised controlled trial.
